[+ Add a co-founder](#)

How long have the founders known one another and how did you meet? Have any of the founders not met in person?

We met at HKU in Hong Kong over 4 years ago. Started as hackathon partners, became best friends. We've built and shipped 6+ products together since - a study platform we sold for \$50K, a Linkedin Chrome extension that got us a cease-and-desist from Linkedin's legal team, a test-prep app, web agency projects, Engagekit.io and now Flowser.

We work from different countries (Vietnam and Malaysia) but talk every day, build async, and meet up regularly. Even when products fail and we're broke, neither of us has ever considered finding other co-founders. We just like building together too much.

Who writes code, or does other technical work on your product? Was any of it done by a non-founder? Please explain.

Both write code. No contractors, no hires, just us.

Lam (CTO): core infra - AI pipeline, Chrome extension backend, DB, API, analytics. Ex-AWS solutions architect, ex-head of engineering at NASDAQ listed company.

Ky-Nam (CEO): frontend, product design, ship 20 features a day, user-facing features, all distribution. Built a 40M-impression personal brand with \$0 spend.

Are you looking for a cofounder?

No. But open to the idea.

Founder Video

Please record a one minute video introducing the founder(s).*

Read more about the video [here](#). Make sure the file does not exceed 100 MB.

0:00 / 1:05

Company

Company name*

Flowser

Describe what your company does in 50 characters or less.*

AI agents + computers for GTM & business workflows

Company URL, if any

<https://flowser.ai>

If you have a demo, attach it below.

Anything that shows us how the product works. Please limit to 3 minutes / 100 MB.

1:02 / 3:11

[Remove](#)

Please provide a link to the product, if any.

<https://flowser.ai>

If login credentials are required for the link above, enter them here.

JKZZYM or WEHPVB or DYMWQY or GQSPY

What is your company going to make? Please describe your product and what it does or will do.

Flowser is like Jarvis from Iron Man for teams with GTM and automation needs. You hire one agent, onboard it on your accounts, brand voice, and ICP, and it runs your GTM workflows on a schedule — LinkedIn engagement, X posting, outbound prospecting, lead enrichment, deep research.

Each agent gets its own computer, persistent file system, and memory that compounds across every task. It picks up where it left off, learns what your audience responds to, and adjusts.

Today we ship pre-built templates for LinkedIn engagement (our most-used), with plans to launch templates for X personal branding, SEO audits, and outbound. Users can also describe any workflow in plain English and the agent builds it.

Long-term: every founder's growth function should be a closed loop — agent runs, watches, adjusts, compounds. Today LinkedIn. Next X, TikTok, podcast clipping, SEO blog automation, newsletter syndication. Same memory layer.

Where do you live now, and where would the company be based after YC?

Use the format City A, Country A / City B, Country B

Vietnam / Malaysia now. SF after YC.

Explain your decision regarding location.

We'll both relocate to SF for the batch and stay after. Our customers are global from day one - GTM automation demand is the same in SF, London, or Singapore. Being in the US puts us next to the highest concentration of founders and growth teams who are our core users.

Progress

How far along are you?

5 startups in Vietnam, 3 startups in Hong Kong, 2 startups in Singapore
SIHUB (Vietnam Government Start Agency), Saigon High Tech Park, Hong Kong Science Technology Park)

Personal Brand:

50M+ impressions in 10 months. 25M on X, 15M on Reddit (mostly hate threads about me lol), 8M on Threads/Facebook, 5M on LinkedIn. \$0 ad spend.

Waitlist and high-intent leads from community building and existing customers:

20+ AI Events Leads Waitlist: 1000 contacts

Indie builder network: 4 Group chats (Zalo, Messenger, Telegram, Whatsapp) with 800+ builder contacts

EngageKit (previous GTM product) and other product existing waitlist (GTM waitlist): 1500 contacts

How long have each of you been working on this? How much of that has been full-time? Please explain.

Full-time since Nov 2025. Both of us, 100%, no side gigs.

Timeline:

- Nov 2025: pivoted from GeekGrind (test-prep, zero paying users) to EngageKit (LinkedIn tool)
- EngageKit grew to 1,000+ users, ~\$5K lifetime revenue, cease-and-desist from LinkedIn legal
- April 2026: realized OpenClaw (open-source agent framework, 358K GitHub stars) could do everything EngageKit did and more
- Built Flowser in 3 weeks. EngageKit is now one template on the platform.

Before Nov 2025: building products together full-time for ~1 year (both quit jobs early 2024). Before that, Lam was at AWS and head of eng at a Nasdaq-listed company. Nam was running a web agency and shipping side projects.

What tech stack are you using, or planning to use, to build this product? Include AI models and AI coding tools you use.

Backend: Bun, Typescript, SQL, Openworkflow, Openclaw, Composio

Infra: Hetzner, Supabase, Cloakbrowser

AI: Openrouter

Dev tools: Claude + Codex for coding & architectural decisions

Optional: attach a coding agent session you're particularly proud of.

This is an experimental question for the Summer 2026 batch to give people a chance to show off their skills with AI coding tools.

Many coding agents (e.g. Claude Code, Cursor, etc) have a `/export` command, or otherwise include a button allowing you to export a transcript. Can be text or markdown.

Learn more about this question [here](#).

Uploaded File Preview:[Remove](#)

Claude Code Session — Agent Tools & Workspace

Human (1)

now there are issues with the @apps/flowser-container/openclaw-defaults/workspace/skills/collect-linkedin-feed.md skill

the linkedin brand builder agent i created has a saved browser with my linkedin logged in

but so far it has been very slow in using this skill to load posts

this skills is based on code inside /Users/knamnguyen/Documents/0-Programming/engagekit-turborepo/packages/linkedin-automation of another project and is implemented inside an chrome extension wxt /Users/knamnguyen/Documents/0-Programming/engagekit-turborepo/apps/wxt-extension

can you invesgitate carefully and suggest me methods to continue testing to make a better skills? perhaps the sill not only need a single file like this but a folder with separate js utils that it can use and a guide file

Assistant

Let me research both the current skill and the original implementation to understand the gaps.

Assistant

 **Agent** Research the LinkedIn automation implementation in /Users/knamnguyen/Documents/0-Programming/engagekit-turborepo/packages/linkedin-automation/

I need to understand:

1. The full directory structure and all files
 2. How feed collection works - the core logic, utilities, and approach
 3. How URN resolu...
-

Assistant

 **Agent** Research the WXT extension implementation in /Users/knamnguyen/Documents/0-Programming/engagekit-turborepo/apps/wxt-extension/

I need to understand:

1. The directory structure
 2. How the LinkedIn feed collection is used from the extension context
 3. Any content scripts or background scripts related...
-

Assistant

 **Agent** Research the current Flowser container setup for skills:

1. Read /Users/knamnguyen/Documents/0-Programming/flowser-turborepo/apps/flowser-container/ - list all files and understand the structure
 2. Read all files in the openclaw-defaults/workspace/skills/ directory
 3. Read the Dockerfile or docker-...
-

Assistant

[MODE: ORCHESTRATOR]

Research complete. Here's what I found:

Key Issues

1. Skill files aren't deployed to the container

The Dockerfile never COPYs openclaw-defaults/workspace/skills/*.md into the image. The /root/.openclaw/skills directory starts empty. You'd need to either:

- Add a COPY in the Dockerfile
- Upload via the file server API (port 3001)
- Or mount them as a volume

2. cloakbrowser_add_init_script may not be registered properly

It's implemented in plugin.ts but **not listed** in openclaw.plugin.json's tools array. The AI agent may not know it exists or may fail to call it.

3. The monolithic script is fragile and slow

The current skill crams ~400 lines of JS into a single cloakbrowser_evaluate call. The original @sassy/linkedin-automation package is modular with 30+ files across separate concerns. Key performance differences:

Original (extension)	Current skill
MAX_IDLE_ITERATIONS = 10	MAX_IDLE = 3 (gives up too early)
Parallel comment loading with Promise.all + waitForCommentsReadySequential: clicks all, then flat setTimeout(2000)	

Original (extension)

MutationObserver removes "New posts" pill
isUserEditing() guard
Scroll 4x BEFORE processing batch

4. Folder-based skills are supported

start.sh already has logic to npm link any subdirectory in /root/.openclaw/skills/ that has a package.json. This means you can create a skill as a folder with separate JS utility files.

Current skill

Not handled (can block scrolling)
Not handled
Same approach but different loop timing

Recommended Approach

Convert the skill from a single .md to a folder-based skill:

```
skills/collect-linkedin-feed/
├── package.json          # for npm link support
├── README.md             # the guide (what OpenClaw reads as the skill)
├── scripts/
│   ├── init-interceptor.js # Phase 1: fetch interceptor (for addInitScript)
│   ├── check-feed-ready.js # Step 3: feed readiness check
│   └── collect-posts.js    # Step 4: main collection loop
├── utils/
│   ├── urn-resolution.js  # URN lookup from componentkey
│   ├── extract-author.js  # Author extraction
│   ├── extract-caption.js # Caption/text extraction
│   ├── extract-comments.js # Comment extraction
│   ├── extract-time.js    # Time parsing
│   ├── filters.js         # Promoted/company/friend detection
│   └── scroll.js          # Load more + scroll logic
└── diagnostics/
    └── check-selectors.js  # Runtime selector verification
```

Benefits:

- The guide file references scripts by path — the agent reads the script file and passes it to cloakbrowser_evaluate
- Each script is testable independently
- You can iterate on individual pieces (e.g., fix just the scroll logic)
- Diagnostics script lets you verify selectors still work before running the full collection

Immediate testing steps:

1. Verify cloakbrowser_add_init_script is actually available — check if the tool shows up in OpenClaw's tool list
2. Test the init script alone: inject it, navigate to LinkedIn, then run the check-feed-ready script to see if window.__urnMap is populated
3. Test scrolling separately: just the scroll + count logic to see if LinkedIn loads new posts
4. Test post extraction on a single visible post without scrolling

Want me to enter FAST MODE to implement this folder-based skill structure?

Human (2)

1. in the ui though - there is no way for me to view the agent's accessible tools

- we have 2 types of agent - main agent and created agent. Main agent workspace is the root openclaw folder which should show us all files (can you add this to comment in the code so we don't deviate in the future?) while created agent workspace is just the workspace created for that agent (pls add comments)
 - maybe we should show in the setting tab which tools each agent has access to? does openclaw allow the ability to customize/limit which tool each agent can access?
2. i don't know how to test the init script alone - i know it works inside wxt extension
 3. same
 4. same - the wxt-extension and linkedin automation package is well tested

Assistant

Let me research the UI code and OpenClaw's tool configuration capabilities.

Assistant

- Bundled (shipped with the install)
- Managed/local: ~/.openclaw/skills
- Workspace: <workspace>/skills

So **both folders are valid skill sources** — OpenClaw loads from both automatically:

Folder	Path	Purpose
/root/.openclaw/skills/	Managed/local skills	Shared across ALL agents
/root/.openclaw/workspace/skills/Workspace skills		Scoped to the main agent only (since its workspace is /root/.openclaw/workspace)

If both have a skill with the same name, the **workspace version wins**. That's why you see duplicates — the agent (or seeding) put copies in both locations. The linkedin-brand agent would only see skills in /root/.openclaw/skills/ (shared) plus its own workspace at /root/.openclaw/workspace-linkedin-brand/skills/ (if any exist there).

So the duplication is harmless but unnecessary. The top-level /skills/ folder is the right place for skills you want ALL agents to access.

Human (17)

yeah so technically the create-agent skill should only be in the workspace folder (not all agent should be able to create new agent) and the linkedin feed collect skill should only be in the agent workspace linkedin brand builder?

Assistant

Exactly right. Makes much more sense:

Skill	Where it should live	Why
create-agent.md	/root/.openclaw/workspace/skills/ (main agent workspace only)	Only the main agent should create new agents
collect-linkedin-feed.md	/root/.openclaw/workspace-linkedin-brand/skills/	Only the LinkedIn Brand Builder needs this

Neither should be in /root/.openclaw/skills/ (shared) since they're agent-specific, not global.

Want me to clean this up on the running container?

Assistant

Bash curl -s http://localhost:55006/files/workspace-linkedin-brand/skills/ 2>&1 — Check linkedin-brand agent's workspace skills

Assistant

The linkedin-brand agent already has collect-linkedin-feed.md in its workspace. So the current state and what needs to change:

Location	Currently has	Should have
/root/.openclaw/skills/ (shared)	collect-linkedin-feed.md, create-agent.md	empty (nothing global)
/root/.openclaw/workspace/skills/ (main agent)	collect-linkedin-feed.md, create-agent.md	create-agent.md only
/root/.openclaw/workspace-linkedin-brand/skills/	collect-linkedin-feed.md	collect-linkedin-feed.md (already correct)

Want me to remove the extras from shared and main workspace?

Human (18)

yes do it

Assistant

Bash curl -s -X DELETE http://localhost:55006/files/skills/collect-linkedin-feed.md 2>&1 — Remove collect-linkedin-feed from shared skills

Assistant

Bash curl -s -X DELETE http://localhost:55006/files/skills/create-agent.md 2>&1 — Remove create-agent from shared skills

Assistant

Bash curl -s -X DELETE http://localhost:55006/files/workspace/skills/collect-linkedin-feed.md 2>&1 — Remove collect-linkedin-feed from main workspace

Assistant

Done. Let me verify:

Assistant

```
Bash curl -s http://localhost:55006/files/skills/ 2>&1 && echo "----" && curl -s
http://localhost:55006/files/workspace/skills/ 2>&1 && echo "----" && curl -s
http://localhost:55006/files/workspace-linkedln-... — Verify final state of all skills folders
```

Assistant

Clean:

Location	Contents
/root/.openclaw/skills/ (shared)	empty
/root/.openclaw/workspace/skills/ (main agent)	create-agent.md, seo-keyword-research/
/root/.openclaw/workspace-linkedln-brand/skills/collect-linkedln-feed.md	

Human (19)

alright now for the collect-linkedln-feed, is there a way for you to help me test the agent with its browser and watch its logs to see if it's working and if not where is it stuck and why?

Assistant

Yes — let me figure out what I can monitor. The container should have logs and session transcripts.

Assistant

```
Bash curl -s http://localhost:55006/files/logs/ 2>&1 — Check logs directory
```

Assistant

```
Bash curl -s http://localhost:55006/files/agents/linkedin-brand/sessions/ 2>&1 | python3 -c "import
sys,json; files=json.load(sys.stdin); [print(f['name'], f['size'], f['modified']) for f in sorted(files, ...
— Check linkedln-brand agent's recent sessions
```

Assistant

```
Bash # Check if we can access the OpenClaw API directly (port 55005 = openclaw port 3000) curl -s
http://localhost:55005/api/health 2>&1 | head -20 — Check OpenClaw API health
```

Assistant

Good — there are session transcripts. The most recent one (5851539f...) was updated 10 minutes ago. Let me check what happened in it:

Assistant

```
Bash # Get the most recent session transcript (last 100 lines to see recent activity) curl -s
http://localhost:55006/files/agents/linkedin-brand/sessions/5851539f-ec3d-483a-9052-538eb9706d81.jsonl 2>&1 |
t... — Parse recent session transcript
```

Assistant

```
Bash # The file might be too large for curl text mode. Let me check its size and get the tail curl -s
http://localhost:55006/files/agents/linkedin-brand/sessions/5851539f-ec3d-483a-9052-538eb9706d81.jsonl ... —
Check session file size
```

Assistant

```
Bash `# Get the file and parse it properly curl -s http://localhost:55006/files/agents/linkedin-brand/sessions/5851539f-ec3d-483a-9052-
538eb9706d81.jsonl 2>&1 | python3 -c " import sys, json
lines = sys.st...` — Parse last 30 entries from session transcript
```

Assistant

```
Bash `# Debug: just see raw last few lines curl -s http://loca
```

Are people using your product?

Yes

No

How many active users or customers do you have? How many are paying? Who is paying you the most, and how much do they pay you?

- 30 DAU from private beta (launched last week)
- 3 paying users at \$29/month
- Paying users are agency owners automating LinkedIn engagement for their clients' personal brands. They pay because the pre-built LinkedIn template directly powers their client deliverables — it's not a "nice to have," it's their service offering running on autopilot.

Do you have revenue?

Yes

No

How much revenue?

Not cumulative and not GMV. If none, enter '0'

November 2025

USD\$

December 2025

USD\$

January 2026

USD\$

February 2026

USD\$

March 2026

USD\$

April 2026

87

Where does your revenue come from? If your revenue comes from multiple sources (e.g., multiple products, multiple companies or a mix of consulting and this product), please break down how much is coming from each source.

Subscription

Anything else you would like us to know regarding your revenue or growth rate?

We are in private beta and haven't done growth. We are building targeted pilots with business teams to ensure reliability, effectiveness, and scalability before public launch.

If you are applying with the same idea as a previous batch, did anything change? If you applied with a different idea, why did you pivot and what did you learn from the last idea?

We applied last batch with EngageKit — a LinkedIn engagement Chrome extension. 1,000+ users, ~\$5K lifetime revenue.

Why we pivoted: When computer-use agents shipped (Anthropic, OpenAI, OpenClaw hitting 358K stars), we studied the architecture and realized: EngageKit's entire product is one workflow that a general-purpose agent can do. We rebuilt it in 3 weeks as a Flowser template.

The pivot wasn't abandoning EngageKit — it was realizing EngageKit was proof of one workflow on a much bigger platform we were positioned to build.

What we learned:

- From EngageKit: founders don't want tools, they want to outsource the workflow. "Set and forget" is the pull — a Chrome extension structurally can't deliver that (needs your laptop open)
- From GeekGrind: build for people who can pay. We had users but couldn't charge \$5/mo. Founders pay \$29/mo for a LinkedIn tool without blinking
- From LEAN Social (sold for \$50K): we can build, ship, and monetize fast

Three products, same problem at better solution, more focused each time.

If you have already participated or committed to participate in an incubator, "accelerator" or "pre-accelerator" program, please tell us about it.

Non-dilutive grants from Hong Kong Science & Technology Parks (~\$14K, 2024) and Cyberport Hong Kong (~\$14K, 2023) under previous companies. No equity taken, no ongoing obligations. Not currently in any program.

Idea

Why did you **pick this** idea to work on? Do you have domain expertise in this area? How do you know people need what you're making?

- LinkedIn sent our previous tool a cease-and-desist. We know which workflows are valuable enough that incumbents defend against them — and how to do them on the user's own browser in a way platforms can't shut down.

We know people need it because 20 of 30 beta users have a scheduled workflow running daily — week one. Most agent platforms struggle to keep users past the first session. Ours is part of their morning routine.

Who are your competitors? What do you understand about your business that they don't?

What we understand: founders don't need an "agent platform." They need their growth function to run while they sleep. The moment a workflow is scheduled and just works, they stop thinking about it. We optimize for "set and forget." Everyone else optimizes for "setup and configure."

How do or will you make money? How much could you make?

(We realize you can't know precisely, but give your best estimate)

- \$29/month flat per agent (includes one computer). Extra AI usage billed at 1.5x cost.

- No tiers, no per-seat. Pricing matches "an extra hire" not "a tool."

Near-term: convert 20 daily-active beta users + BuyMed pilot to paid. Target \$10K MRR in 90 days from existing pipeline (1,500 GTM contacts, 1,000 builders, 1,000 event leads).

Which category best applies to your company?

B2B SaaS

If you had any other ideas you considered applying with, please list them. One may be something we've been waiting for. Often when we fund people it's to do something they list here and not in the main application.

Flowser for manufacturing operations. Lam's career (and IPO tech prospectus at Luda Development) was about automating traditional business ops with AI. Tons of paperwork-heavy workflows — supplier onboarding, RFQ handling, customs docs, compliance audits — still run on email + Excel. Sunwah (one of our pilot conversations) raised this directly. Parked because GTM has stronger demand signal right now.

Unnamed AI Training via phone: Manufacturing businesses employinng manual labor can shoot SOP videos. Technicians wear their phones on the head where AI scan in real time, compare with SOP and give feedback to wearer. Huge potential for data to train robotics.

Chatstack — Substack for group chats. Syncs messages from any group chat (WhatsApp, Telegram, Discord, Zalo) into a dashboard with analytics, AI summaries, search, and paywall features. Built a prototype for our buildstuffs.com community (1,000+ builders). Every paid community has the same problem: value is in the chats but chats are unsearchable and unmonetizable. Real category but would compete with Flowser for our distribution focus.

Equity

Have you formed ANY legal entity yet?

This may be in the United States, in your home country or in another country.

Yes

No

Please list all legal entities you have and in what state or country each was formed (e.g. Delaware C Corp, Mexican SAPI, Singapore Pvt Ltd, etc.).

This might include subsidiary companies, legal entities you formed in other markets to do business, entities you created before a pivot, or legal entities you set up to employ developers or other service providers.

Hong Kong LLC. Will convert to Delaware C-Corp if accepted to YC.

Please describe the breakdown of the equity ownership in percentages among the founders, employees and any other stockholders. If there are multiple founders, be sure to give the equity ownership of each founder and founder title (e.g. CEO).

50/50

Have you taken any investment yet?

Yes

No

List any investments your company has received. Include the name of the investor, the amount invested, the premoney valuation / valuation cap, the type of security sold (convertible notes, safes or stock), and the investment date.

Non-dilutive grants from Hong Kong Science & Technology Parks (~\$14K, 2024) and Cyberport Hong Kong (~\$14K, 2023) under previous companies. No equity taken, no ongoing obligations. Not currently in any program.

How much money have you raised from investors in total in US Dollars?

0

How much money does your company have in the bank now?

15000\$

How much money do you spend per month?

1000\$

How long is your runway? (e.g. 5 months)

over a year

Are you currently fundraising?

Yes

No

Curious

What convinced you to apply to Y Combinator? Did someone encourage you to apply? Have you been to any YC events?

We've been following YC founders and partners for years - Garry Tan's talks on founder- market fit, Dalton Caldwell on pivots, Michael Seibel on application strategy.

What really got us was Paul Graham's original vision for YC - a hacker house where builders support builders. No corporate theater, just nerdy people shipping code and helping each other grow. That philosophy is exactly what I (Ky-Nam) have been trying to build in Vietnam and Southeast Asia with buildstuffs.com - 1,000+ builders, 50+ co- building sessions across 3 cities, inspired by the PayPal Mafia model where founders who come up together keep supporting each other long after. Very bootstrap, very hacky, very nerdy. YC is the original version of that, and we want to be part of it.

We also know YC-backed founders in the region. Jun Yuan Tan from Homebase (YC- backed, Ho Chi Minh City) has seen our product firsthand - we demoed EngageKit to him in person and update him on our progress regularly. He's been encouraging us to apply. We also connected with the Marathon Education founders on LinkedIn, who shared their experience going through YC as Vietnamese founders and encouraged us to go for it.

When we got into the interview of last round, the feedback from Garry and Grey meant the world to us. We are still determined to be scrappy and persistently trials and errors, but be smarter about market product innovation to get out of the wedge trap.

This is our fourth application. We're not applying because we need permission. We're applying because Flowser is the first product where our domain expertise, distribution ability, technical skills but most importantly - big market demand all converge - and YC is the best network in the world to scale it.

How did you hear about Y Combinator?

Can't pinpoint when. We've followed YC content (Garry Tan, Dalton Caldwell, Michael Seibel) for years.

Batch Preference

What batch do you want to apply for?

Summer 2026

A batch after Summer 2026
